New product

Scope

Roto Line window handles and geared-handles are now available with the Roto AVT antiviral and UV-resistant coating. Roto AVT stands for antiviral technology and is proven to be widely effective against viruses, bacteria and fungal spores that could stick to a handle.

Roto AVT renders them inactive and therefore harmless. The risk of smear infections and new infection chains is significantly reduced by Roto AVT.

Roto AVT is transparent, thin-layered and barely perceptible to the touch. The coating produces a very hard, pore-free surface

Roto AVT does more than just simplify cleaning and disinfection of window handles; it also gives the window handle an antibacterial, fungicidal and virucidal effect.

Availability / Ordering ability

Manufacturers of aluminium windows within the European Union (EU) are now able to order Roto Line window handles and geared-handles with the Roto AVT coating.
