### Technical Details

New in the product range:

For aluminium windows with the euro groove system, we have developed a so-called transport and construction site safety device for gearboxes as a supplementary article.

**article number:** 2030883

**gross:** 1,99 €

**unit:** 200 (bulk packaging)

#### Field of application:

- Developed to prevent unintentional opening of windows and thus damage to windows during the construction phase.
- The plastic part is screwed onto the sash with a screw on the gearbox instead of the handle - during the construction phase (note: screw not included). This prevents other trades from opening the windows with a screwdriver or similar and possibly leaving them open overnight.
- By loosening the screws, the component can also serve as a temporary "auxiliary handle", as the component can be used to switch the hardware; this means that the sash can only be opened by authorised personnel.
- The screw can be selected so that it may have a special drive; this means that the screw cannot be removed with a standard tool.
- It is also stamped on the component that these components must not be removed. (safety instruction)

**Further information:**

- Can be used for aluminium windows with Euro groove. Please check the application of the component with alternative profile systems, frame material or opening types by checking the profile (PA) and sample testing.
- The component can be used with all gearboxes that are used in an aluminium window with a Euro groove and have a hole spacing of 43 mm.
- Only for flush encased gearboxes. (not for geared handle)
- Reusable: the components can also be reused on other construction sites once the construction phase is complete and the final handles have been used.
- In Roto packaging (customised packaging possible at extra cost)

**Sampling is recommended.**

Availability / Ordering ability

can be ordered now, available from December 2023.
