The articles will be updated in the next version of the following document:
IMO_403: Roto Patio Inowa installation instruction for timber and PVC profiles

Description

Roto has added a new roller track for Patio Inowa to the product range. The Inowa roller track is suitable for outside running timber elements and it has 2 walls, so that Inowa elements with a height-width ratio of 3:1 can be built with the anti-tilt protection. The roller track has already integrated the necessary drainage millings.

Before using the new roller track a Patio Inowa profile check must be done to avoid collisions between the walls and the sash profile.

The roller track is available in the lengths of 3.2m and 6.4m.
