Update IMO_423

Description

Our threshold profiles are now equipped with a newly designed temporary protective cover.

This cover reliably protects the surface of the aluminum profile from scratches and dirt—both during handling and installation.

Textual notes and pictograms on the cover indicate that it must be removed after installation. If the cover is not removed and is exposed to direct

sunlight for an extended period, it may become difficult to remove later. Therefore, we recommend removing it promptly after installation. The transition to the new cover will take place gradually in production. During the transitional phase, some products may still be delivered with the previous, unprinted cover. This approach supports the resource-efficient use of existing materials and avoids unnecessary waste.
